

Is it safe?

Yes! This FDA cleared technology was developed in Europe and is currently used around the globe for the repair and treatment of soft tissue and improved blood circulation. A wealth of medical experience, state of the art engineering and optimal quality have been built into each device, and extensive clinical studies and tests have confirmed its safety and efficacy.

If performed by a qualified medical professional, this non-invasive treatment approach has virtually no risks or side effects. In some cases, patients may experience some minor discomfort which may continue for a day or two.

What if I have a health condition?

The safety and effectiveness of this procedure has not been determined on people with the following health conditions.

- Prostate Cancer
- Other Malignancies
- DVT (Deep Vein Thrombosis)

Your doctor will provide you with information about how these and other conditions might affect the determination to perform the procedures.

How much does it cost?

This treatment is considered an elective procedure and is not covered by insurance. Your specific course of treatment will be determined by the doctor at ED Clinics of Indiana and must be paid in full prior to treatment rendered.

6 treatment package - \$3,210

1 individual treatment - \$595

*You are not alone.
Millions of men suffer from ED.*

Erectile Dysfunction (ED) is a result of poor blood flow to the penis. Due to the narrowing of blood vessels, erections are difficult and sometimes impossible to maintain.

Despite the variety of medication available to treat this issue, many men, due to medical conditions and adverse side effects, still struggle.

Acoustic Pressure Wave Therapy (APWT) is clinically proven and does not have the risks, complications and discomfort of pills, injections, penile implants and surgery.

What is APWT?

APWT is a highly effective, non-invasive procedure that represents a breakthrough treatment option for erectile dysfunction.

Clinical evidence shows that APWT generates a significant clinical improvement of erectile function as well as improvement in penile blood flow without any adverse effects.

How does APWT work?

Acoustic pressure waves are delivered to the treatment area, encouraging neovascularization in the penis shaft creating new blood vessels in the penile tissue which enables the patient to achieve and maintain firm erections.

What are the expected results?

After the series of treatments, many patients report:

- Improved erectile function
- Increased stimulation
- Decreased pain
- Improved satisfaction

How is the treatment performed?

Coupling gel is applied to the penis to enhance effectiveness. After these preparations, acoustic pressure waves are released via the applicator and moved over the treatment area in a circular motion.

What is the duration of the treatment?

The treatment is performed in ED Clinics of Indiana's office. The treatment session takes approximately 30 minutes and does not require anesthesia. You can return to normal activity immediately following treatment. Generally, 6 treatment sessions are necessary, once per week.
